

Uniwell-the POS Industry's best kept secret

Security

An embedded POS terminal is an 'all-in-one' solution with no separation between operating system and POS application. This singular purpose provides greatly enhanced security, as users can't access the internet and introduce external information to the POS terminal's memory.

Reliability

Uniwell's proprietary technology removes risk areas in relation to system reliability. POS features are specifically designed to be robust and easy to operate. Third-party applications can't be loaded onto the dedicated POS terminal, so stability is not compromised.

Operational speed

At Uniwell we have been developing and refining our POS technology for decades. A properly configured Uniwell POS system provides superior functionality, while still being faster and simpler to use for an operator than many other point of sale products.

Purpose-built hardware

Embedded POS terminals are specifically designed to cope with the day-to-day requirements of high-volume hospitality and retail venues. Uniwell has a long-standing reputation for quality POS hardware that can handle the physical workload that a standard tablet, laptop or PC may not.

Hardware Specification

Operator Display	15.6" high resolution wide LCD WXGA Standard size (1366 x 768)	Interface 1 x Ethernet 10/100Mbps for - IRC network - internet connect 4 x RS232C (PC standard pin layout) 5 x USB host 1 x microSD card interface for - collection of report data - data backup, - upload / download of program data & graphic images - firmware update 2 x Cash drawer (24V drive, one connector)
